UI/UX PORTFOLIO & PROJECT APPROACH

Complex ERP, made clear and ready to work.

A workflow-first design proposal for a web ERP covering users, sales, procurement, inventory, and accounting. Built around the decisions each role needs to make every day.

User & Roles | Sales | PR / PO | IMS / Inventory | Accounting

HAURUX ERP Concept
UI/UX & Product Systems

37
mapped web screens for the proposed ERP scope

5
core business modules connected end to end

1
reusable design system for consistent handoff

PREPARED FOR

UI/UX Design for ERP Web Application

Self-initiated concept study · Flexible online collaboration

CONCEPT / DEMO

© 2026 Zhenghao Zhang

UNDERSTANDING THE WORK BEHIND EVERY SCREEN

Your brief, translated into a usable ERP experience.

The project calls for the complete UI/UX of a web ERP, not isolated visuals. The response below turns each requirement into a concrete design outcome.

BRIEF ASKS	DESIGN RESPONSE	FIT
All web-app pages	A 37-screen inventory with shared patterns for list, detail, create/edit, approval, and reporting.	Mapped
User module	User directory, profiles, role-based access, permission review, and auditable activity.	Covered
Sales module	Customer → quotation → order → fulfilment → invoice, with status and exception handling.	Covered
PR / PO	Purchase request, approval, vendor comparison, PO, receiving, and three-way-match readiness.	Covered
IMS / Inventory	Item master, warehouse stock, transfers, adjustments, receiving, and low-stock signals.	Covered
Accounting	AP, AR, invoice status, journals, reconciliation, and traceable source-document links.	Covered
Flexible meetings	Async-first checkpoints plus scheduled online review windows during working hours.	Ready

01

Workflow first

Each screen has a role, decision, next action, and recovery path, so the experience stays operational, not decorative.

02

Dense, still readable

ERP data is structured through hierarchy, progressive disclosure, saved filters, and consistent table patterns.

03

Safe by default

Permissions, approvals, validation, audit trails, and destructive-action safeguards are designed from the start.

SCOPE ASSUMPTION Desktop-first responsive web application. Final entities, fields, approval levels, tax rules, and integrations are validated in discovery before high-fidelity production.

37

SCREEN MAP

PROPOSED INFORMATION ARCHITECTURE

Complete enough to estimate. Flexible enough to validate.

This inventory defines the first design baseline. Shared drawers, modals, filters, import/export, loading, empty, error, and permission states are included as component variants, not counted as extra screens.

Foundation & Navigation — 05 screens

01	Sign in & account recovery	02	My profile & preferences
03	Global search & quick actions	04	Notification center
05	Activity & audit log		

User & Access — 05 screens

06	User directory	07	Create / edit user
08	User detail & activity	09	Roles & permissions
10	Access review queue		

Sales — 08 screens

11	Sales dashboard	12	Customer list
13	Customer detail	14	Quotation list
15	Create / edit quotation	16	Sales order list
17	Sales order detail	18	Fulfilment & delivery

PR / PO — 08 screens

19	Purchase request list	20	Create / edit PR
21	PR detail & approval	22	Request for quotation
23	Vendor comparison	24	Purchase order list
25	Purchase order detail	26	Goods receiving

IMS / Inventory — 06 screens

27	Inventory dashboard	28	Item master list
29	Item detail & stock card	30	Warehouse & bin view
31	Stock transfer	32	Adjustment & cycle count

Accounting — 05 screens

33	Accounting dashboard	34	Accounts payable / bills
35	Accounts receivable / invoices	36	Journal entries
37	Bank reconciliation		

Definition of “screen”

A distinct job-to-be-done route or workspace, not every modal or component state.

CONCEPT SCOPE

ROLE-BASED EXPERIENCE

The right action, for the right person.

ERP usability depends on what is hidden, available, or approval-gated. This concept applies least-privilege access while keeping everyday work fast.

AD — Admin
Users, roles, master data, audit, system settings.

SA — Sales
Customers, quotations, orders, fulfilment visibility.

PR — Procurement
PR review, RFQ, vendors, PO preparation.

WH — Warehouse
Receiving, stock, movement, cycle count.

FI — Finance
Bills, invoices, journals, reconciliation.

AP — Approver
Threshold-based review, approve, reject, delegate.

Capability	AD	SA	PR	WH	FI	AP
User & role management	M	N/A	N/A	N/A	V	V
Customer & quotation	M	C	V	V	V	A
Sales order & fulfilment	M	C	V	M	V	A
Purchase request	M	C	C	C	V	A
RFQ, vendor & purchase order	M	V	M	V	V	A
Goods receiving	M	V	V	M	V	A
Stock transfer & adjustment	M	V	V	C	V	A
Bills, invoices & payments	M	V	V	V	M	A
Journal & reconciliation	M	N/A	N/A	N/A	M	A
Audit log & export	M	V	V	V	M	V

V View · C Create / process · A Approve · M Manage · N/A No access

Approval thresholds

Route by amount, department, warehouse, or risk. Show due time, SLA, and fallback approver.

Action-level protection

Separate “view” from “post”, “approve”, “void”, “export”, and “adjust”, not only page access.

Full traceability

Record actor, timestamp, previous value, reason, attachment, and linked source document.

PROCURE TO STOCK

PR → PO → Receive → Inventory

CONCEPT / DEMO

One linked chain of evidence, from business need to physical stock and payable readiness.

01 Purchase Request
Requester adds purpose, item, quantity, cost center.

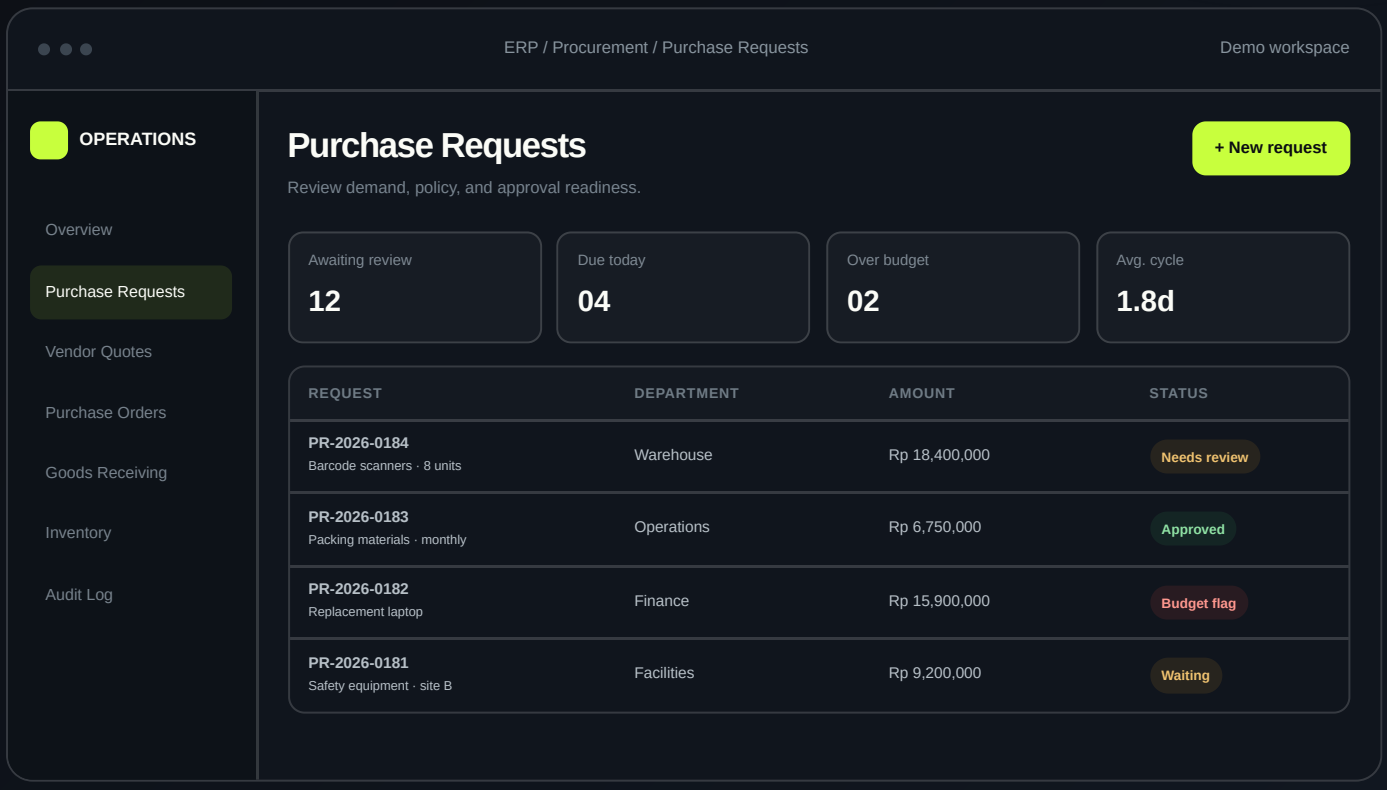

02 Approval
Amount and policy determine the approval route.

03 RFQ & Compare
Normalize vendor terms, lead time, price, tax.

04 Purchase Order
Approved selection becomes a controlled PO.

05 Goods Receipt
Warehouse records quantity, lot, variance, proof.

06 Stock & Match
Ledger updates; Finance checks PO / GR / invoice.

Partial receipt
Track received, pending, rejected, and backordered quantities without losing the original PO context.

Price / quantity variance
Explain mismatch at line level and route only the variance for approval, not the whole transaction.

Low-stock signal
Connect reorder suggestions to open PRs and POs to prevent duplicate purchasing.

ORDER TO CASH

Sales, fulfilment, and finance in one traceable flow.

Users see the commercial promise, physical fulfilment, and financial outcome as one connected record without re-entering the same data.

1 **Customer & quotation** — SALES
Price list, discount guardrail, validity, tax, and attachments.

2 **Sales order confirmation** — SALES + APPROVER
Availability, credit limit, promised date, and approval exceptions.

3 **Pick, pack & dispatch** — WAREHOUSE
Reservation, partial fulfilment, serial / lot, proof of delivery.

4 **Invoice generation** — FINANCE
Generate from delivered quantity, payment terms, and source documents.

5 **Payment & reconciliation** — FINANCE
Match bank activity, handle partial payment, close balance.

ACCOUNTING COCKPIT

What Finance needs at a glance

Accounts receivable 12 invoices · 3 overdue	Rp 284.6m
Accounts payable 8 bills · 2 due this week	Rp 119.2m
Unmatched bank lines Requires reconciliation	07
Draft journals Awaiting review / posting	04

Source-document completeness 94%

01 **Credit & discount controls**
Surface limit, exposure, margin, and approval reason before confirming the order.

02 **Promise vs. availability**
Show available-to-promise by warehouse, substitute, and expected replenishment date.

03 **Source-linked accounting**
Every invoice and journal links back to order, delivery, receipt, or approved adjustment.

04 **Exception-driven worklist**
Prioritize overdue, mismatched, blocked, duplicated, and unposted items instead of static reports.

Partial fulfilment
Split delivery while preserving remaining committed quantity and customer visibility.

Credit hold
Explain the blocking rule and present request-for-override as a controlled action.

Payment matching
Recommend matches with confidence and keep a human confirmation trail.

CONSISTENCY AT ERP SCALE

A system, not 37 disconnected mockups.

Reusable tokens and interaction patterns reduce design debt, speed development, and make new ERP modules feel familiar from day one.

CORE PALETTE

Ink	Action	Canvas	Success	Critical
#0B0D12	#C8FF3D	#F4F5EF	#237A4C	#B6433C

TYPOGRAPHY

Readable by default.

Clear numeric alignment, stable hierarchy, compact density, and minimum readable sizes for operational screens.

Display / 40 Heading / 24 Body / 14 Meta / 12

ACTIONS	Create order	Save draft	Export	Void document	
FORM FIELDS	Search customer or order…	Warehouse: Jakarta ▾	Date range ▾		
STATUS	Approved	In progress	Needs review	Blocked	
TABLE BEHAVIOR	Saved views	Column controls	Bulk actions	Sticky totals	Export log

REQUIRED INTERFACE STATES

Empty
Explain why nothing appears and offer the next useful action or import path.

Loading
Preserve table shape and prevent accidental duplicate submissions.

Error
State what failed, what was preserved, and how to retry or seek support.

Read-only
Explain which permission or document state prevents editing.

Accessibility

WCAG-aware contrast, keyboard focus, semantic labels, non-color status cues, and large interaction targets.

Responsive strategy

Desktop-first workflows, tablet-safe detail views, and prioritized mobile approvals instead of squeezed desktop tables.

Developer handoff

Named components, variants, tokens, spacing rules, responsive notes, validation, and prototype behavior.

COLLABORATIVE, REVIEWABLE, HANDOFF-READY

A phased path from ambiguity to build-ready UI.

Rather than designing every page in isolation, I validate the riskiest workflows first, lock shared patterns, then scale confidently across the full screen inventory.

PHASE 01

Discovery & workflow audit

Stakeholder interview, current process review, users, entities, business rules, pain points, and technical constraints.

OUTPUTS

Scope baseline
Questions log
Risk map

PHASE 02

Information architecture & UX flows

Navigation, module boundaries, role paths, state model, screen inventory, approval and exception flows.

OUTPUTS

Sitemap
User flows
Permission draft

PHASE 03

Wireframes for core flows

Low-fidelity PR→PO→Receive, Order→Cash, role administration, dashboard and key detail patterns.

OUTPUTS

Wireframes
UX review
Validated patterns

PHASE 04

Design system & high-fidelity UI

Tokens, components, responsive rules, tables, forms, statuses, feedback, and all agreed screens.

OUTPUTS

UI library
Hi-fi screens
State variants

PHASE 05

Prototype, handoff & build support

Clickable priority flows, annotations, asset export, design QA checklist, developer walkthrough, and review fixes.

OUTPUTS

Prototype
Figma handoff
QA support

Recommended planning range: 14 to 20 working days

Final timeline depends on existing documentation, field complexity, number of approval variants, integrations, and response time. Milestones are agreed before production; scope changes are logged explicitly.

Flexible collaboration

Async updates + scheduled online review during working hours. Up to two consolidated review rounds per approved phase.

Figma source

Organized pages, components, variants, and assets.

Clickable prototype

Priority flows for review and development alignment.

UX annotations

Rules, states, permissions, validation, responsive notes.

Handoff support

Walkthrough and focused QA against approved designs.

BEFORE WORK BEGINS

Three answers will turn this concept into your ERP.

A short discovery call can confirm scope, remove assumptions, and set a realistic first milestone.

1. **Is this a greenfield ERP or a redesign?**
   If it is a redesign, can you share demo access, screenshots, SOPs, field lists, or current user pain points?

2. **Which business rules are non-negotiable?**
   Which user roles, approval levels, company and warehouse structures, currencies, taxes, valuation rules, and integrations must be supported?

3. **What should be the first approved milestone?**
   Which module or workflow is highest priority, which viewports matter, and who gives final approval?

Portfolio integrity statement

This document is a project-specific concept proposal created from the public brief. ERP screens, figures, company names, and records shown here are synthetic demo material. They do not represent a claimed past client, production deployment, or measured business result. Final UI is produced only after stakeholder validation.
